

"If I built this at Adobe" — Stack Mapping

This POC is deliberately vendor-neutral. Show you know it mirrors Adobe's own GenStudio pattern, and that the architecture ports directly. This is your credibility multiplier.

YOUR POC COMPONENT	ADOBE EQUIVALENT	THE POINT TO MAKE
<code>generateAssetWithGenAI</code> (Gemini)	Adobe Firefly / Firefly Services (text-to-image API)	Swap behind the one <code>generateImage()</code> seam. Firefly's pitch is commercially-safe, enterprise-indemnified generation, which matters for the exact compliance problem I'm solving.
<code>renderAspectRatios</code> + <code>applyOverlay</code> (Sharp)	Firefly Generative Expand + Photoshop API; InDesign API for templated layout	Smart-crop and layer compositing become API calls instead of raw Sharp math; brand templates live in InDesign / Express.
<code>existingAssetPath</code> reuse	AEM Assets (DAM) + Creative Cloud Libraries	"Reuse vs. generate" becomes a DAM lookup against approved brand assets, not a file path.
<code>complianceChecker</code> (color / logo / words)	GenStudio brand checks; AEM Smart Tags / Content Tagging; Content Credentials (C2PA)	My heuristics map to managed brand-guideline checks, plus provenance via Content Credentials for "is this AI-made and on-brand."
<code>campaignWorkflow</code> + brief schema	GenStudio for Performance Marketing	This is the headline: brief-to-variants-at-scale IS the GenStudio pattern. My contract-driven workflow is the same shape.
<code>storage adapter</code> + manifest	AEM Assets for storage; Frame.io for review + approval	Outputs flow into an approval workflow, not just a folder. Manifest becomes asset metadata.
<code>cost ledger</code> + <code>Zod</code> contracts + logs	My value-add layer on top	Observability and typed contracts are what make any of the above trustworthy in a customer's prod.

ONE-LINER POSITIONING

"I built this neutral on purpose so the pattern is portable. The architecture, a typed brief contract, then gather, render, brand, and compliance as isolated steps, drops straight onto Firefly Services for generation and GenStudio for orchestration. The seams I designed, the storage adapter and the single `generateImage()` function, are exactly where Adobe's APIs would plug in."

SCALE-TO-PROD ON ADOBE (IF THEY PUSH)

- Generation: Firefly Services, with custom-trained brand models per client where available.
- Orchestration + durability: a real job queue and a runs table, fronting GenStudio-style variant generation.
- Brand + legal: managed brand checks + Content Credentials for provenance, replacing my three heuristics.
- Review: Frame.io approval gates before assets are published.
- Asset lifecycle: AEM Assets as the system of record for reuse and governance.

Sanity-check exact product names out loud only if confident. If unsure, say "Adobe's generation API" or "Adobe's brand-check tooling" and let them supply the precise name. Getting the architecture mapping right matters more than the exact SKU, and never guess a feature you can't defend.
