

Replit Verification Prompt

Paste verbatim into Replit. Confirms Quick Start, cost numbers, and Dropbox status before final README polish.

I need three specific fixes to ensure the README and project are accurate and submission-ready. Please complete all three and then report back.

Fix 1: Confirm Quick Start commands are accurate

Open package.json and confirm the scripts section. The README claims a reviewer can clone the repo and run:

```
npm install
cp .env.example .env
npm run dev
```

Then open <http://localhost:5173>.

Verify:

1. Does npm run dev exist as a script in package.json?
 2. Does it start both the frontend (Vite) and backend (API server) in a single command? If not, document the actual commands needed.
 3. What port does the frontend actually serve on? Is it 5173 or something else?
 4. Does .env.example exist at the repo root with all required env vars listed? It should include GEMINI_API_KEY at minimum, plus STORAGE_ADAPTER and DROPBOX_ACCESS_TOKEN as commented-out optional vars.
- If any of these are not configured correctly, fix them so that the Quick Start in the README works exactly as written.

Fix 2: Report the actual campaign cost from the cost tracker

Run one full campaign with the Vitara Naturals sample brief and storage set to local. After the run completes, report back:

1. The total AI cost shown in the Run Report panel
2. The total number of AI calls
3. The total tokens used
4. The wall-clock duration

I need the exact numbers because the README cost section claims "\$0.25-\$0.30 per six-creative campaign" but a previous run showed \$0.0444 total. I need the truth so the README matches reality.

Fix 3: Confirm Dropbox implementation status

Report the current state of the Dropbox storage implementation:

1. Did the Dropbox adapter implementation complete successfully?
2. Did the test run with STORAGE_ADAPTER=dropbox upload assets to Dropbox successfully?
3. Did the regression test with STORAGE_ADAPTER=local produce the same output as before?
4. Are there any errors or partial implementations I need to know about?

If Dropbox is fully working: confirm so I can leave the README claim as written.

If Dropbox is partial or failed: tell me what's working and what isn't so I can soften the README language to match reality.

Report all three back in a structured format so I can update the README accordingly.
