

"If I built this at Adobe"

This POC is vendor-neutral on purpose. Show it mirrors Adobe's GenStudio pattern and ports directly. Your credibility multiplier.

POC → ADOBE

generateAssetWithGenAI → Adobe Firefly / Firefly Services

Swaps behind one generateImage() seam. Firefly = commercially-safe, indemnified generation, which is the whole compliance pitch.

renderAspectRatios + applyOverlay → Photoshop API + InDesign API

Smart-crop + compositing become API calls instead of raw Sharp. Brand templates live in InDesign / Express.

existingAssetPath reuse → AEM Assets (DAM) + CC Libraries

"Reuse vs. generate" becomes a DAM lookup against approved brand assets.

complianceChecker → GenStudio brand checks + Content Credentials (C2PA)

My heuristics map to managed brand-guideline checks, plus provenance.

campaignWorkflow + brief schema → GenStudio for Performance Marketing

The headline: brief-to-variants-at-scale IS the GenStudio pattern. Same shape.

storage adapter + manifest → AEM Assets + Frame.io

Outputs flow into a review/approval workflow, not just a folder.

ONE-LINER POSITIONING

"I built it neutral on purpose so the pattern is portable. A typed brief contract, then gather, render, brand, compliance as isolated steps, drops straight onto Firefly Services for generation and GenStudio for orchestration. My seams, the storage adapter and the single generateImage() function, are exactly where Adobe's APIs plug in."

SCALE-TO-PROD ON ADOBE (IF PUSHED)

- Generation: Firefly Services, custom brand models per client.
- Durability: real job queue + runs table fronting variant generation.
- Brand + legal: managed checks + Content Credentials for provenance.
- Review: Frame.io approval gates before publish.
- Assets: AEM Assets as the system of record.

CAVEAT: name exact products only if confident. Unsure? Say "Adobe's generation API" and let them supply the name. The architecture mapping matters more than the SKU. Never guess a feature you can't defend.
